

Pallet live storage.

Excellent space utilisation for Fifo method.

Characteristics

Jungheinrich pallet live storage consists of racking uprights forming a channel. Storage is carried out on one side and retrieval on the other side of racking. As soon as a pallet is retrieved, the other pallets move up automatically to the retrieval position on inclined roller conveyors. Brake rollers keep gravity under control and an automatic separating device ensures that the pallet at the front is never under impact pressure from the following pallet. Automatically operated roller conveyors within a channel are available as an option.

Application

Pallet live storage is suitable for large quantities of the same articles. In keeping with the Fifo method, they ensure that goods are rotated effectively.

Operation

Pallet live storage is serviced using conventional fork lift trucks.

Vorteile

- Optimised filling ratio
- Optimised space utilisation
